

## INDIVIDUAL ASSIGNMENT - WEB FRONT-END DEVELOPMENT (20%)

Read the following instructions. Please ask if you need further assistance.

**ASSIGNMENT TITLE:** Tourism in Malaysia (pick 1 tourism spot in Malaysia only)

**SUBMISSION:** **Week 13** in UiTM UFUTURE ( **video** and **source code**)

**FILE TYPE:** ZIP file ONLY (Compress all files as ZIP file together with the SQL file)

### PROJECT OVERVIEW

You are required to develop a dynamic web application using JSP and Java Servlet for a tourism spot in Malaysia. The system has two main parts:

1. The Public Website: Where visitors learn about the location and submit inquiries.
2. The Admin Portal: A secured area where staff can log in to manage and view visitor inquiries.

Technical Stack: JSP, Java Servlets, JDBC, MySQL (or any DBMS), and jQuery DataTables.

### PART 1: Public Tourism Website (Front-End)

1. **Home:** Introduction to the location with a "Hero" image.
2. **Gallery:** Exactly eight (8) images showing the beauty of the spot.
3. **Activities:** Showcase four (4) things to do (include images and descriptions).
4. **Accommodation:** Showcase four (4) places to stay (include images and descriptions).
5. **Developer Page:** Your photo, name, student ID, and contact details.
6. **Navigation:** A consistent menu bar must be available on every page.
7. **External Link:** Include a Google Maps link that opens in a new browser tab (target="\_blank").

### PART 2: Visitor Inquiry System (Form & Database)

1. **Form Fields:** Name, Contact Number, Gender, Email Address, "How did you know about us?" (Dropdown), and Message.
2. **Validation:** All fields are compulsory (the form should not submit if a field is empty).
3. **Database Saving:** When the "Submit" button is clicked, a Servlet must capture the data and save it into a MySQL database using JDBC.
4. **User Feedback:** After saving, display a success message (e.g., "Inquiry Sent Successfully!") to the user.
5. **Reset:** The "Clear" button must empty all form fields instantly.

### **PART 3: Admin Portal (Security & Data Management)**

1. **Admin Login:** Create a login screen. The system must check if the username and password are correct.
2. **Session Security:** Use HttpSession. If a user tries to access the Admin Dashboard URL without logging in, the system must redirect them back to the login page.
3. **Admin Dashboard:** Once logged in, the admin should see a list of all inquiries submitted by visitors.
4. **Data Presentation:** The list must be displayed using a jQuery DataTable (supporting Search, Sort, and Pagination).

**RUBRIC**

| Criteria                              | Score                                                                                    |                                                                                               |                                                                                            |                                                                                                   | Total Score |
|---------------------------------------|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|-------------|
|                                       | 1 (Poor)                                                                                 | 2 (Fair)                                                                                      | 3 (Good)                                                                                   | 4 (Excellent)                                                                                     |             |
| <b>UI/UX &amp; Navigation (15%)</b>   | The navigation bar is missing or links are broken. The layout is messy and hard to read. | A navigation bar is present but paths are inconsistent. The layout lacks professional polish. | Consistent navigation bar on all pages. Good layout and overall usable interface.          | Professional, responsive UI. Seamless navigation and intuitive user experience across all pages.  |             |
| <b>Content &amp; Gallery (15%)</b>    | Missing images or descriptions. Required counts (8 gallery, 4 items) are not met.        | Required counts met but content is poor quality, irrelevant, or generic.                      | All images (8 galleries, 4 activities, 4 rooms) and descriptions are present and relevant. | High-quality imagery and engaging, well-formatted descriptions. The layout is visually balanced.  |             |
| <b>Database Persistence (20%)</b>     | Form exists but data is not saved to the database. Frequent SQL errors occur.            | Data saves but with missing fields, incorrect data types, or database mapping errors.         | Successful save of all form fields into MySQL via a Java Servlet.                          | Robust JDBC logic. Handles all data types perfectly and includes system-generated timestamps.     |             |
| <b>Security &amp; Sessions (20%)</b>  | Login is non-functional or the Admin area has no protection (accessible via direct URL). | Login works but session tracking is weak; dashboard is still accessible without logging in.   | Functional login and session control. Unauthorized users are redirected to login.          | Secure session handling with a functional logout feature and strict access control logic.         |             |
| <b>Admin Dashboard (20%)</b>          | No dashboard exists or data is displayed in a plain, unformatted list.                   | Data is displayed in a standard HTML table without any extra features.                        | Dashboard uses the jQuery DataTable plugin with basic search and pagination.               | Fully optimized DataTable with advanced sorting, multi-field filtering, and professional styling. |             |
| <b>Organization &amp; Video (10%)</b> | No SQL file or video demo provided. The ZIP folder structure is disorganized.            | SQL file is present but broken. Video is unclear or skips core technical requirements.        | Complete ZIP with working SQL file. Video demonstrates all core functionality.             | Professional folder structure. Clear, high-quality video walkthrough explaining the full system.  |             |
| <b>Total (100)</b>                    |                                                                                          |                                                                                               |                                                                                            |                                                                                                   |             |
| <b>Total 20%</b>                      |                                                                                          |                                                                                               |                                                                                            |                                                                                                   |             |
